

Data Backup and Replication | secure storage in the cloud

Data is crucial to your business. That's why you have someone responsible for changing out the tape and taking a copy offsite.

But how many times has the tape been forgotten? How many times has a backup job failed because the tape was full or had gone bad?

Until recently, data protection was often considered an extra IT expense. Today, having an encrypted storage and backup service is the standard for business continuity and data availability.

Service

Our **Managed Backup** and **Replication** service ensures that your servers and your user devices are backed up on an automated schedule and stored in highly secure data center infrastructure.

Managed Backup and **Replication** also ensures that your data remains encrypted in transit and at rest during the versioning process, so you can meet the compliance requirements of such regulations as HIPAA, SOX, and PCI. And because it's all in the cloud, you can access your critical data using any device, anywhere, at any time.

Flexibility

We work with you to determine how often your backups need to be made, so if your network goes down, you'll be able to quickly and safely restore to your backups and resume business as usual.

Whether yours is a small business a established corporation, we offer several service level options that fit your data protection needs.
